

COVID-19: Safer procedures with endoFaster

COVID-19 emergency is stressing the need for safer procedure for infection risks.
New guidelines suggest stronger protocol for EGD procedures (*)

Endofaster real-time gastric juice analysis allow safer upper GI procedures against infections.
Endofaster analysis reduce 30% - 60% of biopsies in a routine EGD (**)

Less biopsies = less infected samples
✓ in endoscopy room
✓ in pathology

Less time = shorter procedure
with and for the patient

Less bleedings = less infection risks for the patient
= less complications for nurses and doctors

Less people in hospital =
patients don't come back for the report
because they received it in real time
